

Dynamo Sprocket locking system
Received from Don Littleford via Rick:

Rick,

I refer to recent discussions in the group regarding the system that holds the dynamo sprocket in place .
Could you include the following details in the archives .

Attached are photos of the lock washer , nut and spring clip , and also in the installed position .

The special lock washer has internal serrations that grab the nut's hex edges. The lock washer also has 2 arms turned down at the ends that fit into the slots on the sprocket .

The plain washer and nut are tightened on the dynamo shaft. The lock washer is then placed over the nut with the arms engaging the sprocket slots. The nut has a groove cut into it, and the lock ring is fitted into the groove. It holds the lock washer on the nut. Could you include the details in the archive .

Regards Don
